

Access local network from android

Continue

Access local network from android emulator. What does local network access mean. What is allow access to local network.

First, enable screen pinning: Go to Settings > Security & location > Screen pinning and toggle on Screen pinning. Next, open the app you want to pin. Then, tap the square app switcher, and then tap the thumbtack (screen pinning icon). To unpin the app: Tap and hold the back and app switcher buttons. This article explains how to use guided access functionality on Android devices, which is called "screen pinning." Screen pinning lets you lock only one app to the screen of your device so other apps are inaccessible or unusable. This is helpful if you share your device with a child. Before you can activate screen pinning, you'll have to turn it on. Open the Settings app. Tap Security & location > Screen pinning. Tap the screen pinning toggle switch to enable the feature. You can also tap Ask for PIN before unpinning if you want screen pinning to use your PIN when attempting to unpin an app. Once you've activated the feature, it's easy to use screen pinning anytime you want to limit access to your device. Open the app you want to pin. Tap the square app switcher icon to open the app switcher screen. Tap the thumbtack Screen pinning icon. The screen of the selected app is now pinned. To unpin the app, simply tap and hold the back and app switcher buttons. If you didn't enable PIN locking, you'll return to your home screen. Otherwise, you'll be prompted to enter your PIN before returning to your device's home screen. Guided access functionality is called "screen pinning" on Android devices. When enabled, all parts of the pinned app can be used as normal, but users can't return to the home screen, open the app switcher, or switch to the previous app until Screen pinning is disabled. There are two modes that Screen pinning can operate in when enabled: Under the first mode, holding the back button and app switcher button is all that's needed to disable Screen pinning and re-enable normal OS usage. In the second mode, the same button combination must be used, but this then shunts users to the lock screen, where the device PIN must be entered to resume normal OS usage. The main use for screen pinning is locking down app access for children. If you share your main Android device with a child, you may not want them getting into your texts, emails, or other sensitive areas. For younger children, the button-only unpinning mode is usually sufficient to quickly pin the app before you hand off the device and quickly unpin it when they're done. Screen pinning is also useful when a friend wants to use your device, but you don't want them poking around outside of the app you want them to access. For this, you'll likely have to use the PIN locking mode, thereby preventing them from using the easier button combination to deactivate screen pinning and circumvent your protections. While these are the two most common use cases, there are a couple of other situational instances where screen pinning can come in handy. For instance, the button-PIN combination mode is useful for lending your phone to a stranger who needs to make an emergency call. For a more novel use, if you have a friend you really trust, you could use Screen pinning as a productivity hack. If you want to lock yourself out of changing apps so you don't get distracted and wander over to Facebook, you could have your friend pin your productivity app with a PIN you don't know, then have them unlock it when your task is done. Thanks for letting us know! Get the Latest Tech News Delivered Every Day [Subscribe](#) Tell us why! Local app search is something that's been on the best Android phones for a while now, but Android 12 changes the interface a bit. With the update, Google combines local app search into a more universal local search which will return results for contacts, apps, and even system settings. This is a bit of a mixed blessing if you rely on just searching for apps. Plus, having results mixed in with contacts and other data can get a little busy. But there's a new layer added to this that can help. AppSearch is a new development for Android 12 that allows developers to tie in not only their app, but even functions and documents within those apps. For example, if you search for the word "new," you'll get the option to create a new document Docs or a new alarm in Clock. As a user, you just need to start searching, and you'll see what options are available to you. Here's how to do that. Searching for an app on your Android 12 phone is as easy as opening the app drawer. Swipe up from the middle of the screen to access the app drawer. In the app drawer, tap Search your phone and more at the top. Type the name of the app you want to search for. As you type, the results will populate with apps, system settings, and contacts that meet the criteria. If your text doesn't yield results, search Google by tapping Search on Google. Source: Adam Doud/Android Central. Local Search test notes: When searching for terms, contacts will display first, followed by apps that have a matching function. For example, when you search for "te" in the search box, you'll get a "Test contact," plus "Choose template" from the Docs app and "New text note" from Keep Notes. After that, you'll get system settings, such as "Hotspot and tethering" and Pixel tips like "Send texts from your computer." Finally, after all of that, you'll get the option to Search on Google if none of those options match what you're looking for. Further, as of this writing, only Google apps have functions in this menu. A search for new gives you the option for a "New incognito tab" in Chrome or "Create new alarm" in the Clock app, but there's no option for New message in Facebook messenger, for example. AppSearch is a new development, so we wouldn't be surprised to see more apps tie into this functionality in the future. Source: Adam Doud/Android Central. Needless to say, if you're searching for an app name, you may need to scroll down past contacts to reach the relevant apps. It's important to note that a search is limited to app names and functions within the apps. Searching for "Pizza" will not get you Little Caesars, and we're fairly confident that's not just a condemnation of Little Caesars' cuisine. Source: Adam Doud/Android Central. We'd like to see the option to search the Play Store in the menu. That seems like an obvious oversight, especially for search terms that don't return a result other than searching for Google. Otherwise, we like how the local search works, and we're excited to use it on Android 12. Have you listened to this week's Android Central Podcast? [Subscribe](#) in Pocket Casts: [Audio](#) [Subscribe](#) in iTunes: [Audio](#) (opens in new tab) Since the COVID-19 pandemic hit, I have three different networks in my home—one for work, one for home, and one as a backup. The thing is, Android isn't always smart enough to know which wireless network I prioritize. One would think a feature like this would be baked into the Android platform. It's not. In order to make that work to my liking, I use an app called WiFi Prioritizer. With this free application, I can set the exact priority I need for my home network and even temporarily disable networks that I don't want the phone to use. So if you're looking for the ability to prioritize your networks in Android, this app might be just what you need. Let's install it and see how it works. SEE: [TechRepublic Premium editorial calendar](#): IT policies, checklists, toolkits, and research for download (TechRepublic Premium) What you'll need The only thing you'll need is a device running Android—a phone or a tablet. How to install WiFi Prioritizer The installation of WiFi Prioritizer is quite simple. Just follow these steps: Open the Google Play Store on your Android device. Search for WiFi Prioritizer. Tap the entry by Robert Botha. Tap Install. Allow the installation to complete. With the app installed, locate the launcher in your App Drawer and tap it to open WiFi Prioritizer. How to use WiFi Prioritizer When WiFi Prioritizer opens, you should see all of the wireless networks your device has connected to (Figure A). Figure A WiFi Prioritizer lists out the networks I use. You can disable a specific network from being prioritized by tapping its associated checkbox, so make sure to do that in order to prevent those networks from being considered. To prioritize a network, tap and hold the drag button (the small square of dots) and locate it to where you want it in the hierarchy. For example, if you have Network A and it's your top priority, drag it to the top of the list. Place all of the other networks in the order you want them used. Make sure Enable Scheduled Job (at the top of the window) is Enabled, which allows the app to run a scheduled job to periodically scan for new networks and prioritize accordingly. How to configure the single strength tipping point Within the Settings, there's an option that allows you to set the signal strength that will trip a disconnect from a network. What this does is set a low-bar percentage that will cause the app to automatically switch to a higher priority network that has a higher signal strength. In effect, you can prioritize your networks and then set a signal strength tipping point that will make sure that your device is always connected to the network in your list that not only prioritized, but has the highest signal strength. This feature is great when you work or live in a larger building and signal strength is an issue. To set the signal strength, tap the menu button in the upper-right corner of the main window and tap Settings. In the resulting window, tap Signal Strength To Connect (Figure B). Figure B Setting a Signal Strength To Connect. Drag the handle to the percentage you want to set. By default it's 30%, but you might want to raise that, if you want to ensure you always have a connection that has a higher signal strength. For instance, say you don't want to be using a signal that's less than 50%. For that, drag the handle to 50% and click OK (Figure C). Figure C Setting the percentage for your Signal Strength To Connect. That's pretty much the gist of using WiFi Prioritizer to prioritize the wireless networks your Android device connects to. This feature should be a part of the basic Android platform—maybe someday it will be. Until then, give this app a try and see if it doesn't help you always connect to the right wireless network.
